

Logistic Regression

Dr François Pitié

Problem 1. Recall that for a feature vector \mathbf{x} and parameter vector \mathbf{w} , the likelihood of success is modelled as:

$$h_{\mathbf{w}}(\mathbf{x}) = p(y = 1|\mathbf{x}) = \frac{1}{1 + e^{-\mathbf{w}^T \mathbf{x}}}$$

Show that the likelihood of failure is $p(y = 0|\mathbf{x}) = h_{\mathbf{w}}(-\mathbf{x})$.

answer:

$$p(y = 0|\mathbf{x}) = 1 - p(y = 1|\mathbf{x}) = 1 - \frac{1}{1 + e^{-\mathbf{w}^T \mathbf{x}}} \quad (1)$$

$$= \frac{1 + e^{-\mathbf{w}^T \mathbf{x}} - 1}{1 + e^{-\mathbf{w}^T \mathbf{x}}} \times \frac{e^{+\mathbf{w}^T \mathbf{x}}}{e^{+\mathbf{w}^T \mathbf{x}}} \quad (2)$$

$$= \frac{1}{e^{+\mathbf{w}^T \mathbf{x}} + 1} = h_{\mathbf{w}}(-\mathbf{x}) \quad (3)$$

Problem 2. Recall that

$$E(\mathbf{w}) = \sum_{i=1}^n -y_i \log(h_{\mathbf{w}}(\mathbf{x}_i)) - (1 - y_i) \log(1 - h_{\mathbf{w}}(\mathbf{x}_i))$$

$$\text{with } h_{\mathbf{w}}(\mathbf{x}) = \frac{1}{1 + e^{-\mathbf{w}^\top \mathbf{x}}}$$

Show that

$$\frac{\partial E}{\partial \mathbf{w}} = \sum_{i=1}^n (h_{\mathbf{w}}(\mathbf{x}_i) - y_i) \mathbf{x}_i$$

answer:

$$\frac{\partial}{\partial \mathbf{w}} h_{\mathbf{w}}(\mathbf{x}) = \frac{\mathbf{x} e^{-\mathbf{w}^\top \mathbf{x}}}{(1 + e^{-\mathbf{w}^\top \mathbf{x}})^2} = h_{\mathbf{w}}(\mathbf{x})(1 - h_{\mathbf{w}}(\mathbf{x}))\mathbf{x} \quad (4)$$

$$\frac{\partial}{\partial \mathbf{w}} \log(h_{\mathbf{w}}(\mathbf{x})) = \frac{1}{h_{\mathbf{w}}(\mathbf{x})} \frac{\partial}{\partial \mathbf{w}} h_{\mathbf{w}}(\mathbf{x}) = (1 - h_{\mathbf{w}}(\mathbf{x}))\mathbf{x} \quad (5)$$

$$\frac{\partial}{\partial \mathbf{w}} \log(1 - h_{\mathbf{w}}(\mathbf{x})) = \frac{1}{1 - h_{\mathbf{w}}(\mathbf{x})} \frac{\partial}{\partial \mathbf{w}} (1 - h_{\mathbf{w}}(\mathbf{x})) = -h_{\mathbf{w}}(\mathbf{x})\mathbf{x} \quad (6)$$

Say $E(\mathbf{w}) = \sum_{i=1}^n e_i(\mathbf{w})$. Then we have

$$\frac{\partial}{\partial \mathbf{w}} e_i(\mathbf{w}) = \begin{cases} -\frac{\partial}{\partial \mathbf{w}} \log(h_{\mathbf{w}}(\mathbf{x}_i)) = -(1 - h_{\mathbf{w}}(\mathbf{x}_i))\mathbf{x}_i = (h_{\mathbf{w}}(\mathbf{x}_i) - y_i)\mathbf{x}_i & \text{if } y_i = 1 \\ -\frac{\partial}{\partial \mathbf{w}} \log(1 - h_{\mathbf{w}}(\mathbf{x}_i)) = h_{\mathbf{w}}(\mathbf{x}_i)\mathbf{x}_i = (h_{\mathbf{w}}(\mathbf{x}_i) - y_i)\mathbf{x}_i & \text{if } y_i = 0 \end{cases}$$

Thus

$$\frac{\partial E}{\partial \mathbf{w}} = \sum_{i=1}^n (h_{\mathbf{w}}(\mathbf{x}_i) - y_i) \mathbf{x}_i$$

Problem 3. Adapt the cross entropy loss function below to include a regularisation term (ie. penalty on \mathbf{w} for deviating from the null vector):

$$E(\mathbf{w}) = \sum_{i=1}^n -y_i \log(h_{\mathbf{w}}(\mathbf{x}_i)) - (1 - y_i) \log(1 - h_{\mathbf{w}}(\mathbf{x}_i))$$

Derive the gradient $\frac{\partial E'}{\partial \mathbf{w}}$ for the new expression of the loss function $E'(\mathbf{w})$.

answer:

There is nothing complicated here. For instance a L2 regularisation would look like this:

$$E'(\mathbf{w}) = E(\mathbf{w}) + \lambda \|\mathbf{w}\|^2$$

with $\lambda > 0$ (recall that $\|\mathbf{w}\|^2 = \mathbf{w}^\top \mathbf{w}$).

The gradient is also quite simple:

$$\frac{\partial E'}{\partial \mathbf{w}} = \frac{\partial E}{\partial \mathbf{w}} + 2\lambda \mathbf{w} \quad (7)$$

$$= \sum_{i=1}^n (h_{\mathbf{w}}(\mathbf{x}_i) - y_i) \mathbf{x}_i + 2\lambda \mathbf{w} \quad (8)$$

Problem 4. Compute the gradient $\frac{\partial f(\mathbf{x})}{\partial \mathbf{x}}$ of

$$[1] \quad f(\mathbf{x}) = \frac{1}{2} \mathbf{x}^\top \mathbf{A} \mathbf{x} + b \quad , \text{ with } \mathbf{A} \text{ symmetric} \quad (9)$$

$$[2] \quad f(\mathbf{x}) = \cos(\mathbf{a}^\top \mathbf{x}) \quad (10)$$

$$[3] \quad f(\mathbf{x}) = \sum_{i=1}^n \lambda_i \exp\left(-\frac{\|\mathbf{x} - \mathbf{a}_i\|^2}{2}\right) \quad (11)$$

answer:

$$[1] \quad \frac{\partial f}{\partial \mathbf{x}} = \mathbf{A} \mathbf{x} \quad (12)$$

$$[2] \quad \frac{\partial f}{\partial \mathbf{x}} = -\sin(\mathbf{a}^\top \mathbf{x}) \mathbf{a} \quad (13)$$

$$[3] \quad \frac{\partial f}{\partial \mathbf{x}} = -\sum_{i=1}^n \lambda_i \exp\left(-\frac{\|\mathbf{x} - \mathbf{a}_i\|^2}{2}\right) (\mathbf{x} - \mathbf{a}_i) \quad (14)$$
